

Nuzzi Apps Readme

How to install:

- 1) Drag and drop the zip folder into content manager add the app will auto install.
To check the app has installed correctly, you should see all your LUA apps here:

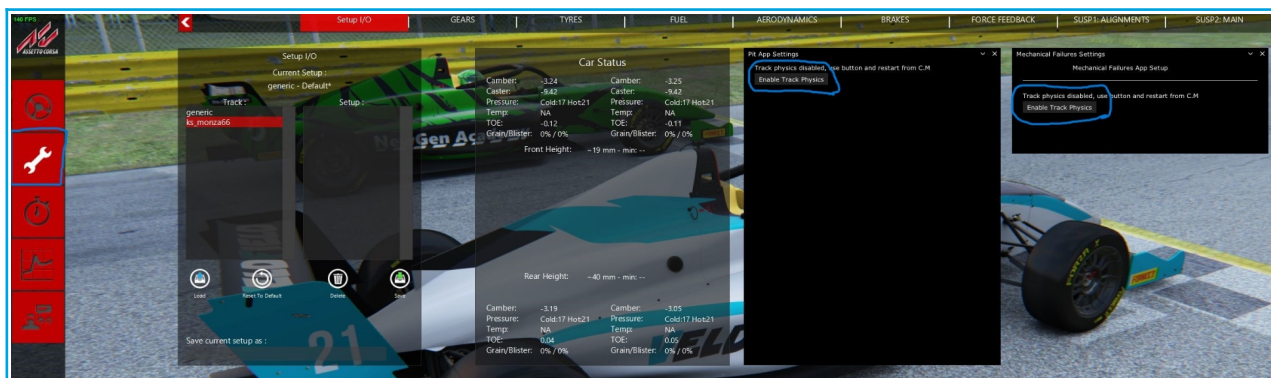

- 2) I recommend un-ticking all AI Retirement settings in CSP New Behaviour like I have below:

- 3) Finally, each time you are using a new track you will need to “enable track physics” for my apps to work. Each of my apps will have the button located:

(Images on next page)

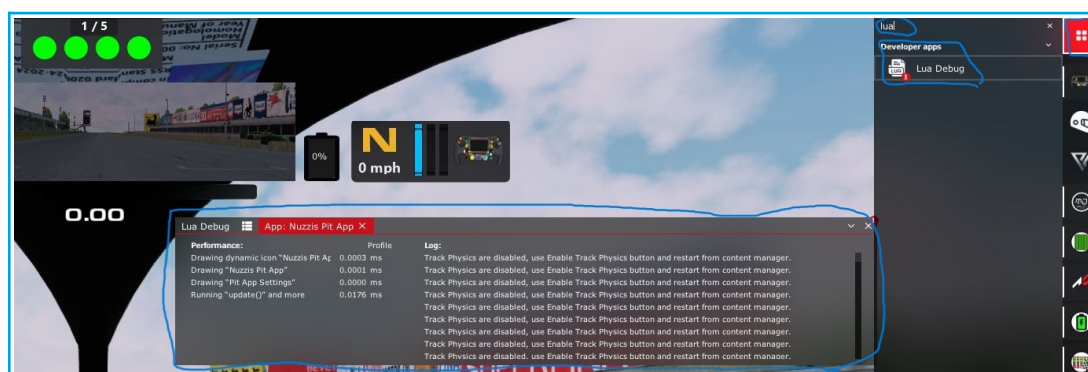

Press it then restart the session from Content Manager and the app will be up and running! (I have left a button to disable track physics with each app. Track Physics needs to be disabled to play online again without being kicked from servers!)

Other info:

I recommend using CSP 0.2.3, I have found that to be a very stable version. However, I will try to update each of my apps to support the latest full version releases as they come out!

I also recommend making use of the LUA Debug app that comes with CSP if you are having any issues. This app will show all of the logging output and can point you in the right direction if something is not working with one of my apps. You can find it in a session like in the picture below:

Once again, thank you for either purchasing the apps or being a member!
